

Academic Year: (2019 / 2020)

Review date: 21-03-2019

Department assigned to the subject: Department of Economics

Coordinating teacher: DELGADO GONZALEZ, MIGUEL ANGEL

Type: Compulsory ECTS Credits : 6.0

Year : 2 Semester : 2

STUDENTS ARE EXPECTED TO HAVE COMPLETED

Mathematics for Economics I
 Mathematics for Economics II
 Statistics I
 Statistics II
 Principles of Economics
 Microeconomics

COMPETENCES AND SKILLS THAT WILL BE ACQUIRED AND LEARNING RESULTS.

This course offers an introduction to data analysis in Social Science with the assistance of the multiple regression model. The emphasis is on the interpretation of the model and the application of statistical inference techniques to solve relevant practical problems. The course discusses in detail how to make inferences under non-standard situations, relevant in Social Sciences, due to the nature of the variables in the model (qualitative, transformed to allow nonlinear relations or non-observable,) or to the nature of data. The rigorous formal justification of the applied statistical inference techniques is out of the scope of this course. The background in Probability, Statistics, Algebra and Calculus offered in Mathematics I & II and Statistics I & II is more than enough for this course.

At the end of the course, the student will acquire a good working knowledge on the interpretation of the linear regression model, discriminating between alternative specifications by means of statistical inference, and using GRETL for estimation and hypothesis testing.

DESCRIPTION OF CONTENTS: PROGRAMME

This course offers an introduction to data analysis in Social Science with the assistance of the multiple regression model. The emphasis is on the interpretation of the model and the application of statistical inference techniques with the objective of solving relevant practical problems. The course discusses in detail how to make inferences under non-standard situations, relevant in Social Sciences, due to the nature of the variables in the model (qualitative, transformed to allow nonlinear relations or non-observable) or to the nature of data.

The course follow Chapters 4 to 8 of Stock & Watson (2012). Syllabus:

1. The nature of econometrics and economic data (SW. Ch. 1, 2 & 3)
2. The simple regression model (SW. Ch. 4,5).
3. Multiple regression analysis: estimation (SW. Ch. 6)
4. Multiple regression analysis: inference (SW. Ch. 7)
5. Nonlinear regression using linerar multiple regression (SW. Ch. 8).
6. Discrete choice (SW. Cp. 11).
7. Instrumental variables estimation and two stages least squares (SW. Cp. 12).

LEARNING ACTIVITIES AND METHODOLOGY

The free software GRETL is the main learning tool of this course. The different concepts are discussed in the context of analyzing relevant cases of study in Social Sciences using real data.

Homeworks, to be handed in class periodically, require to use GRETL.

ASSESSMENT SYSTEM

The continuous evaluation consists of 2 exams during the course, whose grade will depend also on the homeworks handed in according to the instructor criteria. The continuous evaluation will only be taken into account if the grade in the final exam is bigger or equal than 4.5.

Continuous Evaluation Grade = Exam 1 \times 0.3 + Exam 2 \times 0.7

"Convocatoria Ordinaria" Final Grade = Continuous Evaluation \times 0.4 + Final \times 0.6 if Final \geq 4.5

"Convocatoria Extraordinaria" Final Grade = $\max\{\text{Continuous Evaluation} \times 0.4 + \text{Final} \times 0.6; \text{Final}\}$ if Final \geq 4.5

% end-of-term-examination: 60

% of continuous assessment (assignments, laboratory, practicals...): 40
