Tools for research in telematic engineering

Academic Year: (2019 / 2020) **Review date: 02-05-2019**

Department assigned to the subject:

Coordinating teacher: MUÑOZ MERINO, PEDRO JOSE

Type: Compulsory ECTS Credits : 3.0

Year : 1 Semester : 1

REQUIREMENTS (SUBJECTS THAT ARE ASSUMED TO BE KNOWN)

Students taking this course are expected to have prior knowledge on probability theory at the basic level (concept of probability, conditional probability, probability distribution function, probability density function, usual probability distributions, etc.) In addition, they are expected to be fluent programmers.

OBJECTIVES

The competencies that are reinforced in this course are:
- Students acquire the learning abilities that enable them to continue studying in a self-regulated and autonomous learning way
- Ability to apply knowledge of mathematics, statistics and science to the problems of Telematics Engineering
- Ability to design and conduct experiments, and analyze and interpret data
- Students know how to use different techniques for the modelling and analysis of the temporal behavior of a telematics system
- Students master the analytical foundations of the performance analysis of networks and telematics applications

After finishing the course, students will be able to:
- Properly design experiments and apply the appropriate statistical methods in order to evaluate different research objectives they will face in their research career
- Apply concepts of graph theory in order to solve problems that require it, and program algorithms on graphs

DESCRIPTION OF CONTENTS: PROGRAMME

The contents of the course are divided into two separated parts. Each one of them is detailed next with their included topics.

1.- Applied statistics

- Design of experiments: Research objectives, data gathering, methodology.
- Descriptive statistics
- Confidence intervals
- Normality test, Levene test
- Statistical hypothesis testing
- Parametric tests such as t-test or ANOVA
- Non-parametric tests such as Kruskal-Wallis or Mann-Whitney.
- Correlation
- Prediction: regression, bayesian networks

2.- Introduction to graphs in telematic systems

- Definition of graph, properties, paths, loops, connectivity, types of graphs
- Shortest path algorithms

LEARNING ACTIVITIES AND METHODOLOGY

The course comprises theoretical and practical sessions. The theoretical sessions will include, in addition to the explanations of the different concepts, examples and case studies. The practical sessions about the applied statistical part include the resolution of practical cases using software tools for statistical analysis. The practical sessions about graph theory include programming at least one

shortest path algorithm.

ASSESSMENT SYSTEM

The applied evaluation system for the 1st opportunity as well as for the 2nd opportunity is the following:
- Final Exam (50% of the total grade)
- Submissions of the resolution of practical cases about statistical analysis, and practical assignment about programming graph algorithms (50% of the total grade)

% end-of-term-examination:	50
% of continuous assessment (assigments, laboratory, practicals…):	50
