

Academic Year: (2019 / 2020)

Review date: 04/05/2020 18:36:54

Department assigned to the subject: Systems Engineering and Automation Department

Coordinating teacher: MORENO LORENTE, LUIS ENRIQUE

Type: Compulsory ECTS Credits : 3.0

Year : 1 Semester : 2

OBJECTIVES

BASICS COMPETENCES

- CB6 Possess and understand knowledge that provides a basis or opportunity to be original in the development and / or application of ideas, often in a research context
- CB7 That students know how to apply the knowledge acquired and their ability to solve problems in new or unfamiliar environments within broader (or multidisciplinary) contexts related to their area of study
- CB8 That students are able to integrate knowledge and face the complexity of making judgments based on information that, being incomplete or limited, includes reflections on social and ethical responsibilities linked to the application of their knowledge and judgments
- CB9 That students know how to communicate their conclusions and the knowledge and ultimate reasons that sustain them to specialized and non-specialized audiences in a clear and unambiguous way

GENERALS COMPETENCES

- CG1 Knowledge and understanding of the theoretical foundations of both industrial processes and services, and communications.
- CG2 Ability to model, identify basic requirements and analyze various processes.
- CG6 Capacity to adapt to changes in requirements associated with new products, new specifications and environments.

SPECIFIC COMPETENCES

- CE1 Ability to design automatic process systems (production machinery, transport and storage systems and quality control) and the interconnection between their different modules (industrial protocols)
- CE2 Ability to integrate and program the different industrial process control systems both from a hardware and software point of view
- CE3 Ability to program and simulate robot control systems at high, intermediate and low levels
- CE4 Ability to implement and simulate a system of intelligent and flexible control of processes and systems

LEARNING RESULTS

As a result of the learning, the student will be able to:

- Know the basics of automation of industrial systems and services (non-industrial): structure, industrial communications and systems control.
- Know the basics of collaborative robotics: structure, sensorization, control, programming, paths / outputs, multi- robot systems, industrial applications and services.
- Analyze and synthesize systems using advanced control: identification methods, fuzzy control, control with reference model, learning systems, control with neural networks, predictive control, etc.
- Use of simulation tools of production systems with continuous and discrete parts: lay-out, warehouses, transport, specific machines, delays, etc.
- Design an automated system of low and medium complexity with its cyber-physical components.

DESCRIPTION OF CONTENTS: PROGRAMME

Common themes of the subjects:

- Automatization and control of processes, plants and factories
- Structures of industrial plants and services according to CI 4.0 model
- Systems engineering and process integration
- Process and plants simulation tools

Specific themes of the subjects:

Intelligent control of processes and factories:

- Fuzzy logic for identification and control of processes and factories
- Neural networks and applications for the identification and control of systems
- Bayesian networks for the modelling of expert systems
- System optimization techniques: genetic algorithms, differential evolution techniques and PSO.
- Applications in industrial and service environments (linear and non-linear).

ASSESSMENT SYSTEM

% end-of-term-examination/test:	0
% of continuous assessment (assignments, laboratory, practicals...):	100

ASSESSMENT SYSTEMS FOR THE STUDY PLAN CONCERNING SUBJECTS

SE1 Participation and class attendance

SE2 2 Individual or group work carried out during the course

System of
evaluation Weighting (%)

SE1 10

SE2 90 (45% each job)
