

Academic Year: (2020 / 2021)

Review date: 09/07/2020 11:09:13

Department assigned to the subject: Electronic Technology Department

Coordinating teacher: CONTRERAS LALLANA, PEDRO

Type: Compulsory ECTS Credits : 6.0

Year : 3 Semester : 2

REQUIREMENTS (SUBJECTS THAT ARE ASSUMED TO BE KNOWN)

Physics
Electronic Components and Circuits

OBJECTIVES

The goal of the course is to allow the student knowing the basic optical devices and transmission media for optical communications, and acquiring the ability to design and evaluate their performance as part of telecommunications links.

To achieve this goal, the following the following competences will be acquired:

- A knowledge of how optical emitters and receivers work and their main applications
- A knowledge of optical transmission media
- A knowledge of photonics components in long haul, Metropolitan and Access Networks
- An ability to design and evaluate an optical communications link, based either on fiber optics or in free space
- An ability to recognize different multiplexing techniques for increasing network bandwidth

DESCRIPTION OF CONTENTS: PROGRAMME

THEORY:

- M0: Introduction to optical communications
 - General structure of a communication system.
 - Advantages and disadvantages of optical fibres.
 - Light propagation in a medium.
 - Physical structure of optical fibres
 - Introduction to the electromagnetic waves. Regions of the electromagnetic spectrum.

M1: Optical sources: LED and laser

- 1.1. Introduction.
- 1.2. Types of emitters: LEDs y LASER.
- 1.3: Operation principle of emitters based on semiconductors.
- 1.4: LED. Efficiencies. Electrical & optical characteristics
- 1.5: LASER. Efficiencies. Electrical & optical characteristics

M2: Propagation, attenuation, dispersion in optical fibers

- 2.1. Introduction: Physical structure, operation principle.
- 2.2. Propagation, Singlemode/Multimode character.
- 2.3: Attenuation, transmission windows.
- 2.4: Dispersion: modal, chromatic, PMD. Bandwidth and distance limitation.

M3: Optical detectors

- 3.1. Introduction: Symbol y characteristics of photodiodes.
- 3.2. Signal conditioning circuits.
- 3.3: Structure and operation principle.

- 3.4: Types of optical detectors.
- 3.5: Noise considerations in optical detectors.

M4: Passive optical components and optical amplifiers

- 4.1. Modulators.
- 4.2. Couplers.
- 4.3: Splitters, isolators, circulators y filters.
- 4.4: Multiplexers, demultiplexers, intervalers. OADMs.
- 4.5: Optical amplifiers.
- 4.6: Optical switches.

M5: Optical transmission

- 5.1. Elements of an optical communication link.
- 5.2. Power balance.
- 5.3: Time balance. Bandwidth

M6: Multiplexing techniques and devices

- 6.1. Multiplexing techniques: TDM, FDM, CDM
- 6.2. Optical Time Division Multiplexing: SONET/SDH
- 6.3: Wavelength Division Multiplexing: CWDM y DWDM

LABORATORY:

- P1: Characterization of a LED. Attenuation and numerical aperture measurement.
- P2: Characterization of a POF based optical communication link
- P3: Passive optical components characterization.

LEARNING ACTIVITIES AND METHODOLOGY

The docent methodology will include:

- Theory: lectures 2 ECTS.

In these classes the basic knowledge the students must learn will be explained: Fiber-optic, emitter and receivers, theoretical concepts related to its application in optical communications, and knowledge of power budget estimation and pulse broadening in optical communication systems.

Examples on lecture of using theoretical concepts and practical use of fiber optics, for being able to select a specific fiber-optic technology depending on the requirements of the network (solving new problems as part of lifelong learning recognition)

- Practical exercises in lectures. 2 ECTS

Problems are developed for being able to estimate dispersion impact on transmission bit rate, attenuation on long haul transmission, students solve them individually or in groups of 2-3 students

- o Practical examples on power budget estimation and pulse broadening
- o Identification of fiber-optic technologies by analyzing manufacturer data sheets and installed networks

- Lab sessions. 2 ECTS

Students must design and execute lab experiments with teacher support, such as:

- o characterizing fiber-optics, emitter drivers and receivers,
- o fiber-optic link evaluation
- o software simulations of optical transmission system
- Being able to measure losses and characterize optoelectronic components and optical systems
- To extract conclusions, they must also analyze, and interpret data, comparing their results con manufacturer data sheets. The students in groups of 2-3 prepare a report prior to the session lab. After measuring on the lab, they must analyze and interpret measured data and prepare a final report.
- Students are required to use commercial software and provide solutions to real-world problems.
- They develop collaborative work, capacity to apply theoretical concepts, and capacity to make an experiment in time meeting desired needs.

ASSESSMENT SYSTEM

% end-of-term-examination/test:	40
% of continuous assessment (assignments, laboratory, practicals...):	60

The evaluation allows knowing the degree of satisfaction of the knowledge goal, thus all work of the students will be evaluated by using continuous evaluation of their activities, exams and lab projects.

% end-of-term-examination/test:	40
% of continuous assessment (assignments, laboratory, practicals...):	60

The following scoring will be used:

a) Short exams: 40%.

-short exams, to assess theory concepts, problem solving abilities and knowledge of contemporary issues affected by novel technologies.

b) Academic activities with the teacher. Lab experiments: 20%.

- Activities must be delivered on time. A theoretical report with expected results must be carried to the lab session

- Evaluation of tools usage and circuits and link performance

- Evaluation of the collaborative work of the members distinguishing roles.

A final report with data and measurements interpretation should be delivered by the group.

- Evaluation of the final report (or lab project memory). Project memory organization and written correctness should be evaluated.

Responsibility of the result is shared by all members.

c) Final exam with questions and problems: 40%. At least a score of 3.5 points out of 10 should be obtained

As an alternative to the continuous evaluation, a final exam with the total value of the assessment
