Storage in Electrical Systems

Academic Year: (2023 / 2024) **Review date: 06-06-2023**

Department assigned to the subject: Electrical Engineering Department

Coordinating teacher: GARCIA PLAZA, MANUEL

Type: Compulsory ECTS Credits : 6.0

Year : 1 Semester : 1

REQUIREMENTS (SUBJECTS THAT ARE ASSUMED TO BE KNOWN)

It is recommended that students have knowledge of electrical engineering such as: circuit theory, electrical systems and drives. It is also desirable, although to a lesser extent, that they have programming and control theory skills.

OBJECTIVES

The general objective of the course is for students to acquire technical experience in energy storage projects.
Specific objectives are:
- That students acquire knowledge of the different storage technologies applicable to electrical systems and specific services and applications in renewable energy plants.
- That students understand the constituent parts, control systems and operation of a storage system.
- That they be able to design the energy management system of a storage system.
- That they acquire the capacity to dimension a storage system for applications of renewable energy plants integration and services to the electricity grid.

DESCRIPTION OF CONTENTS: PROGRAMME

1. Control devices in electrical networks: with and without energy storage systems.
   - Hierarchical control of electrical systems.
   - Common control devices in electrical systems.
   - Modesofoperation.
   - EMS market and specifications.

2. Modes of operation with accumulation systems.
   - Opportunities for the application of storage systems in electrical grid.
   - Description of the applications of storage systems in electrical grid.
   - Energy and power applications.
   - Utility perspective of storage systems in electricitygrids.

3. Energy storage systems in electrical networks.
   - Introduction
   - Comparison of the properties of the storage systems.
   - Storage systems description.
   - Electrochemical batteries.

4. Demonstration of applications in electrical networks.
   - Demonstration: Smoothing of generation slopes with storage systems.
   - Demonstration: Reduction of power peaks with storage systems.

5. Battery sizing.
   - Energy sizing / State of charge estimation algorithms.
   - Power sizing / Maximum power algorithms.
   - Longevity sizing / State of Health algorithms.

6. Practical exercise: Design and implementation of an application for electrical networks with energy storage systems.

LEARNING ACTIVITIES AND METHODOLOGY

The assessment method will consist of the next activities:

- Lectures by proffesionals.
- Practical activities.
- Student presentations.
- Visit to pilot facilities.

ASSESSMENT SYSTEM

Continuous assessment based on homework, laboratory practices, multiple-choice quizzes, participation and oral presentations in the classroom.

% end-of-term-examination:	0
% of continuous assessment (assigments, laboratory, practicals…):	100
