Natural language processing with deep learning

Academic Year: (2023 / 2024)

Review date: 15-05-2023

Department assigned to the subject: Computer Science and Engineering Department

Coordinating teacher: SEGURA BEDMAR, ISABEL

Type: Compulsory ECTS Credits : 3.0

Year : 1 Semester : 2

### OBJECTIVES

- Create and train deep neural network architectures (such as Convolutional Neural Networks, Recurrent Neural Networks, LSTMs, Transformers) and apply them to tackle NLP applications such as text classification, machine translations, information extraction, text simplification and text summarization.

- Study, implement and use word embeddings to represents texts.

### DESCRIPTION OF CONTENTS: PROGRAMME

- 1. Introduction
- 2. Basic NLP Tasks básicas de PLN.
  - Word embeddings. Text similarity.
- 3. Text Classification (CNN; RNN, Transformers)
- 4. Information Extraction.
- 5. Data augmentation.
- 6 Text generation

### LEARNING ACTIVITIES AND METHODOLOGY

The flippled classroom model will be applied:

Each week, the teacher will publish in aulaglobal a Jupyter notebook that describes and contains the implementation of a deep architecture for the resolution of a certain NLP application (for example, the detection of fake news or the anonymization of clinical notes). Students should study and run these notebooks before class.

During class, the teacher will explain the notebook and resolve any possible doubts. Once resolved, the teacher will propose possible improvements and raises new challenges or problems to solve. Students should try to extend or adapt the implementations of notebooks to solve the new challenges posed by the teacher.

The methodology is practical. The classes will have a configuration of work in pairs in a computer room.

Tutoring by appointment is limited to 2 hours per week. These can be online or face to face.

### ASSESSMENT SYSTEM

CONTINUOUS ASSESSMENT. The activities planned during the classes will be valued. 369 / 5.000

- Class participation.

- Development of systems for NLP applications (for example, text classification) with deep learning architectures.

- Participate in some PLN competition.

- Write a scientific article (extension 4-8 pages). The scientific article should describe the architectures, and present and discuss the results obtained.

# % end-of-term-examination:

% of continuous assessment (assigments, laboratory, practicals...): 100
