

Academic Year: (2024 / 2025)

Review date: 04-02-2025

Department assigned to the subject: Electronic Technology Department

Coordinating teacher: GARCIA VALDERAS, MARIO

Type: Compulsory ECTS Credits : 6.0

Year : 3 Semester : 2

REQUIREMENTS (SUBJECTS THAT ARE ASSUMED TO BE KNOWN)

Electronics engineering fundamentals, Digital Electronics, Programming

SKILLS AND LEARNING OUTCOMES

RA1.2: A systematic understanding of the key aspects and concepts of their branch of industrial engineering.

RA1.3: Coherent knowledge of their branch of industrial engineering including some at the forefront of the branch.

RA2.1: The ability to apply their knowledge and understanding to identify, formulate and solve engineering problems using established methods.

RA3.1: The ability to apply their knowledge and understanding to develop and realise designs to meet defined and specified requirements.

RA3.2: An understanding of design methodologies, and an ability to use them.

RA4.3: Workshop and laboratory skills.

RA5.1: The ability to select and use appropriate equipment, tools and methods.

RA5.2: The ability to combine theory and practice to solve engineering problems.

CB1: Students have demonstrated possession and understanding of knowledge in an area of study that builds on the foundation of general secondary education, and is usually at a level that, while relying on advanced textbooks, also includes some aspects that involve knowledge from the cutting edge of their field of study.

CB2: Students are able to apply their knowledge to their work or vocation in a professional manner and possess the competences usually demonstrated through the development and defence of arguments and problem solving within their field of study.

CG1: Ability to resolve problems with initiative, creativity decision-making and critical reasoning skills, and to communicate and transmit knowledge, skills and abilities in the Industrial Engineering area.

CG3: Capacity to design a system, component or process in the area of electronic and automatic engineering in compliance with required specifications.

CG9: Knowledge and capacity to apply computational and experimental tools for analysis and quantification of electronic and automatic engineering problems.

CG10: Capacity to design and carry out experiments and to analyze and interpret data obtained.

CE3: Knowledge of fundamentals and applications of digital electronics and microprocessors.

CE6: Ability to design analog, digital and power electronic systems.

OBJECTIVES

By the end of this subject, students will be able to have:

1. a systematic understanding of the key aspects and concepts of their branch of engineering in microprocessors and embedded systems;
2. coherent knowledge of their branch of engineering including some at the forefront of the branch in microprocessors and embedded systems;
3. the ability to apply their knowledge and understanding of microprocessors and digital electronics to identify, formulate and solve engineering problems using established methods;
4. the ability to apply their knowledge and understanding to develop and realise designs based on small embedded systems to meet defined and specified requirements;
5. an understanding of design methodologies to set and program microcontroller peripherals, and an ability to use them.

6. workshop and laboratory skills.
7. the ability to select and use appropriate equipment, tools and methods for the development of embedded systems;
8. the ability to combine theory and practice to solve problems of microprocessor based digital systems;

In summary, the teaching objectives are:

- Knowing in detail the basic architecture of a reference CPU for embedded systems
- Knowing the different levels of abstraction in the definition of functions and specifications of an embedded system
- Knowing the interrupts subsystem, the timing subsystem, and the input/output subsystems of a reference microcontroller.
- Being able to program libraries for the use of specific peripherals, sensors and actuators, according to a technical user manual
- Being able to analyze the hardware-software set of a simple embedded system
- Being able to allocate resources and conceive at system level the hardware-software set of a simple embedded system
- Being able to implement signal processing functions and sequencers in embedded systems
- Knowing the principles of real-time operation of an embedded system

DESCRIPTION OF CONTENTS: PROGRAMME

1. Introduction to Digital Systems and Embedded systems. Basic concepts.
2. Fundamentals of Computer Architecture
3. Microprocessors:
 - Memory organization, addressing modes and instruction set
 - Input / output subsystems. Structure, Control and Addressing
 - Event management and Interruption System
4. Microcontrollers:
 - Real-time programming
 - Parallel Input / Output Subsystems and External Interruptions
 - Timing subsystems:
 - time control
 - generation and capture of binary signals
 - Analog inputs / outputs
 - Serial communication subsystems (USART, I2C, SPI)
5. Design of embedded systems:
 - Development environment
 - Practical cases

LEARNING ACTIVITIES AND METHODOLOGY

The teaching methodology will include:

- Magisterial Classes, where the students will be presented with the basic knowledge they must acquire. Students will be supplied with lecture notes and key reference texts which will enable them to complete and acquire a more in depth knowledge of the subject.
- Problems Classes, these are aimed at the solving of exercises and examples within the context of real case studies. These classes will be complimented with the resolution of practical exercises on behalf of the student.
- Laboratory Practical Sessions
- Group tutorials

ASSESSMENT SYSTEM

% end-of-term-examination:	50
% of continuous assessment (assignments, laboratory, practicals...):	50

A mixed system has been chosen between continuous evaluation and finalist evaluation. The continuous evaluation consists of:

- Six practical laboratory sessions where students will design, build and evaluate a simple embedded system based on a set of specifications. The assessment will be carried out by checking a series of practical milestones and an individual practical exam (30%)
- A midterm exam on microprocessor systems (20%)

The final exam will consist of an analysis exercise and an embedded system design exercise with a weight of 50%, and a minimum mark of 3.5 out of 10

% end-of-term-examination:	50
% of continuous assessment (assignments, laboratory, practicals...):	50
