

COURSE: POWER ELECTRONICS IN ENERGETICS SYSTEMS 23/24

DEGREE: DEGREE IN ENERGY ENGINEERING YEAR: 3 TERM: 1

WEEKLY PLANNING				
DATE	SESSION	DESCRIPTION	PLACE	
4-sep	1	Course introduction. Power Electronics applications in Energetic Systems 1. Micro-Grids 2. Power Electronics Loads 3. Power Quality Solutions 4. Transmission and Distribution (T&D) Applications	7.2.J05	
8-sep	2	Revision of basic electrical concepts and mathematical tools (I) 1. Instant value, average value, RMS values 2. Instant and average power 3. Periodic waveforms. Fourier Series and harmonics Quality factors for electrical transformations: Power factor, THD, Ripple factor	7.1.H01	
11-sep	3	Revision of basic electrical concepts and mathematical tools (II) 4. Resistors 5. Inductors Transformers 6. Capacitors 7. Power balance. Steady—state operation. Transient operation 8. Filtering	7.2.J05	
15-sep	4	 More exercises on basic electrical concepts and mathematical tools 9. Calculation of the waveform, slope, peak, valley, peak to peak and average values of the inductor current in a switching circuit. 10. Use of Fourier Series to calculate the RMS, THD and delivered power to and R-L load fed by quasi-square waveform (Phase shift modulation) 	7.1.H01	
18-sep	5	DC-DC Converters (I) 1. Introduction to DC-DC converters 2. Buck Converter. Exercise. a. Block diagram of a converter: chopper, LC filter, and free-wheeling diode b. Equivalent circuits c. Waveforms d. Obtaining the voltage and current DC conversion rations using Steady –State conditions.	7.2.J05	
22-sep	6	DC-DC Converters (II) 1. Boost Converter.	7.1.H01	

		a. Waveforms	
		b. Obtaining the voltage and current DC conversion rations using Steady –State conditions.2. Exercise.	
25-sep	7	DC-DC Converters (III) 1. Full Bridge Converter. a. Waveforms b. Obtaining the voltage and current DC conversion rations using Steady –State conditions.	7.2.J05
25-sep	8	DC-DC Converters (IV) 1. Bidirectional Converter: Four-switch Buck-Boost Converter a. Waveforms b. Obtaining the voltage and current DC conversion rations using Steady –State conditions. 2. Exercise.	7.2.J05
29-sep	9	Exercises of DC-DC converters Four-switch Buck-Boost Converter Simulation 1. Introduction to PSIM simulator 2. PWM modulator operation 3. Theoretical and simulated waveforms 4. Theoretical calculation and measurements on the simulated waveforms of the average and RMS values and current ripple.	Computer room 70J04
2-oct	10	AC-DC Converters (I) 1. Introduction to AC-DC converters. Diode. 2. Basic single-phase topologies: half-wave and full-wave rectifier. 3. Non-controlled single-phase full-wave rectifier with C filter: approximation to calculate the output voltage ripple.	7.2.J05
6-oct	11	AC-DC Converters (II) 1. Non-controlled full-wave three-phase rectifier. 2. Non-controlled three-phase full-wave rectifier with C filter: approximation to calculate the output voltage ripple. 3. Non-Controlled three-phase rectifier with RL and RLC loads using infinite-L approximation.	7.1.H01
9-oct	12	 Exercises of AC-DC Converters Single-phase and three-phase full wave rectifier with C filter. Single-phase and three-phase full wave rectifier with inductive load. 	7.2.J05
16-oct	13	DC-AC Inverters (I) 1. Introduction to DC-AC Inverters. Full-Bridge converter with R load. Four quadrants operation 2. Square waveform modulation. Free Wheeling diodes 3. Pros and cons of square waveform modulation 4. 3-Ph bridge square waveform operation 5. Exercise: 1-Ph inverter with square waveform modulation and a RL load 6. Exercise: 3-Ph inverter with square waveform operation and a RL load	7.1.H01
20-oct	14	DC-AC Inverters (II) 1. PWM modulation concept. Relationship between the pulse width (duty cycle) and the average value. Moving average concept. 2. Modulating and carrier signals 3. Relationship between the moving average of the output voltage and the modulating signal 4. Unipolar sinusoidal PWM modulation. Definitions of the amplitude modulation index, m _a , and the frequency modulation index, m _f 5. DC voltage gain	7.2.J05

		6. Harmonic content of the output voltage as a function of m _a and m _f	
		7. Overmodulation and square waveform operation	
		DC-AC Inverters (III). 3-Ph inverters with PWM modulation	
23-oct		1. Three Modulating signals	
		2. DC voltage gain	
	4.5	3. Harmonic content of the output voltage as a function of m _a and m _f	74.004
	15	4. Third-harmonic injection PWM	7.1.H01
		Advanced topologies: Multilevel and Modular converters	
		1. Multilevel converter with clamping diodes. Advantages regarding voltage levels and current THD.	
		2. Modular converters. Series and parallel connections. Economy of Scale	
27	16	DC-AC Inverters (IV). Exercise	7.2.J05
27-oct	16	1. Exercise: 3-Ph inverters with PWM modulation	7.2.305
20 ost	17	Exam I: Fundamentals, DC-DC, AC-DC and DC-AC converters	7.1.1101
30-oct	17	1. Description of Lab Session 1	7.1.H01
2 2004	18	Computer Session 1: AC-DC Converters	Computer room
3-nov	18	The student will develop the simulation of several AC-DC converters, with and without output filter	70J04
		Power Semiconductors and Power Losses	
		1. Main features	
		2. Power Losses	
6-nov	19	3. Diodes	7.2.J05
0-110V	15	4. MOSFET	7.2.303
		5. IGBT	
		6. Basic losses calculation for IGBT	
		7. Basic losses calculation for inductors	
		Thermal management of power converters	
		Temperature effects in power converters	
		2. Thermal – electrical equivalence	
10-nov	20	3. Main conduction thermal models	7.1.H01
		4. Natural convection and forced convection	
		5. Heat-sink calculation (natural convection)	
		6. Heat-sink calculation (forced convection)	
	21	Fundamentals of dynamic modeling of switched converters	
		Steady-state operation, transient operation and small signal	
13-nov		2. Modeling of converters: injected-absorbed-current method 2. Modelilie of the other blacks of the feeth and leave the state of the	7.2.J05
		3. Modelling of the other blocks of the feedback loop	
		4. Block diagram of the complete loop	
		5. Audiosusceptibility and Output impedance	
		Control loop design	
17-nov		Brief introduction to control and Bode diagram.	
	22	2. Loop Stability	7.1.H01
		3. Phase margin and Crossover frequency	
		4. Phase Margin and Transient response	
		5. Requirements of the compensator transfer function	

		6. Type of regulators (PI, type 2 and type 3). Compensator design	
		7. Problem: Design of the control loop of a Buck converter	
		Power converters for renewable energy applications	
20-nov 24-nov 1-dic 4-dic		1. Photovoltaic Systems	
		2. Wind Power Systems	7.2.105
20-nov	23	3. Active and reactive power exchange with the grid	7.2.J05
		4. Three-phase system	
		5. Space phasors and two-dimensional reference frame	
		Exercises: Design of the control loop of a DC-DC converter	
		Modeling and design of the control loop of a DC-DC converter	C
24-nov	24	1. Buck Converter Power Stage and PWM Modulator	Computer room
		2. Simulate in PSIM both converters under input voltage steps and load steps.	70J04
		3. Use different types of compensators (PI)	
		Modeling and control of the current loop of a grid-tied three-phase inverter	
24-nov 27-nov 1-dic 4-dic	25	1. Average model	
		2. Small-signal model	7.2.J05
		3. Feed-forward compensations	
		4. PI compensator design	
		Exam II: Power semiconductor, power losses, Thermal Management, modeling and control loop design of DC-DC converters	
1-dic	26	Functional Blocks of the current loop of a grid-tied three-phase inverter (II) 1. Power Stage 2. Current Filtering and abc to dq Transformation 3. Voltage measurement, voltage re-scaling and abc to dq Transformation 4. PLL 5. Current References Generator 6. P and Q references steps 7. PI regulator and Feed-Forward compensations 8. PWM Modulator 9. Parameter File 10. Instant Active and Reactive Power Meters Note: This session is connected with Lab Session 2. Models and PSIM blocks will be given to students in order to help them to design the complete PV system considered as Lab Session 2.	7.1.H01
4 -1:-	27	Computer Session 2: Grid-tied PV inverter	Computer room
4-aic	27	To complement the contents of session 24, 25 & 26, the complete 3-ph grid-tied inverter will be simulated by means of PSIM.	70J04
		Main electrical protections in power converters	
		1. Overvoltage protection	
11-dic	28	a. Clamping Snubbers.	
		b. dV/dt Snubbers.	7.2.J05
		c. Diode Snubbers.	
		d. IGBT Snubbers.	
		Overvoltage protection for the complete converter.	

	a. Metal-oxide varistors.	
	b. Gas discharge tubes.	
	c. Other devices.	
3. 0	Overcurrent protection.	
	a. Active protection in power-electronics switching devices.	
	b. Fuses and thermal-magnetic circuit breakers.
